Python interface to your NPM and package.json.

Further documentation is available on https://pynpm.readthedocs.io/.
CHAPTER 1

Installation

PyNPM is on PyPI so all you need is:

```
$ pip install pynpm
```
First point PyNPM to your `package.json`:

```python
from pynpm import NPMPackage
pkg = NPMPackage('path/to/package.json')
```

Now you can run e.g. `npm install` from within Python:

```python
pkg.install()
```

Arguments are also support so you can run e.g. `npm run build --report`:

```python
pkg.run_script('build', '--report')
```

Want to use `yarn` instead?

```python
from pynpm import YarnPackage
pkg = YarnPackage('path/to/package.json')
pkg.install()
```

By default NPM output is piped through and the function call will wait for NPM to finish. If you want to silence the output or interact with process pass `wait=False` and you will get a subprocess.Popen object back:

```python
p = pkg.install(wait=False)
p.wait()
```

By default you can run the following NPM commands:

- `build`
- `init`
- `install`
- `link`
- `run-script`
You can also run other NPM commands or restrict which commands you can run:

```python
pkg = NPMPackage('path/to/package.json', commands=['install'])
```
PyNPM is a small API to help you invoke NPM from inside Python.

```python
class pynpm.NPMPackage(filepath, npm_bin='npm', commands=None)
API to an NPM package.json.

Parameters

• filepath – Path to package.json or directory containing the file.
• npm_bin – Path to NPM binary. Defaults to npm.
• commands – List of allowed NPM commands to invoke.
```

Initialize package.

```python
package_json
Read package.json contents.
```

```python
package_json_path
Get package.json file path.
```

```python
class pynpm.YarnPackage(filepath, yarn_bin='yarn', commands=None)
Yarn package.
```

Initialize package.
CHAPTER 4

Additional Notes

Notes on how to contribute, legal information and changes are here for the interested.

4.1 Contributing

Contributions are welcome, and they are greatly appreciated! Every little bit helps, and credit will always be given.

4.1.1 Types of Contributions

Report Bugs

If you are reporting a bug, please include:

• Your operating system name and version.
• Any details about your local setup that might be helpful in troubleshooting.
• Detailed steps to reproduce the bug.

Fix Bugs

Look through the GitHub issues for bugs. Anything tagged with “bug” is open to whoever wants to implement it.

Implement Features

Look through the GitHub issues for features. Anything tagged with “feature” is open to whoever wants to implement it.
Write Documentation

PyNPM could always use more documentation, whether as part of the official PyNPM docs, in docstrings, or even on the web in blog posts, articles, and such.

Submit Feedback

The best way to send feedback is to file an issue at https://github.com/inveniosoftware/pynpm/issues.

If you are proposing a feature:

• Explain in detail how it would work.
• Keep the scope as narrow as possible, to make it easier to implement.
• Remember that this is a volunteer-driven project, and that contributions are welcome :)

4.1.2 Get Started!

Ready to contribute? Here’s how to set up pynpm for local development.

1. Fork the inveniosoftware/pynpm repo on GitHub.
2. Clone your fork locally:
   ```bash
   $ git clone git@github.com:your_name_here/pynpm.git
   
   $ mkvirtualenv pynpm
   $ cd pynpm/
   $ pip install -e .[all]
   
   $ git checkout -b name-of-your-bugfix-or-feature
   
   $ ./run-tests.sh
   ``

   Now you can make your changes locally.

3. Install your local copy into a virtualenv. Assuming you have virtualenvwrapper installed, this is how you set up your fork for local development:

4. Create a branch for local development:

   ```bash
   $ git commit -s
   -m "component: title without verbs"
   -m "• NEW Adds your new feature."
   -m "• FIX Fixes an existing issue."
   -m "• BETTER Improves and existing feature."
   -m "• Changes something that should not be visible in release notes."
   $ git push origin name-of-your-bugfix-or-feature
   
   7. Submit a pull request through the GitHub website.

Chapter 4. Additional Notes
4.1.3 Pull Request Guidelines

Before you submit a pull request, check that it meets these guidelines:

1. The pull request should include tests and must not decrease test coverage.
2. If the pull request adds functionality, the docs should be updated. Put your new functionality into a function with a docstring.
3. The pull request should work for Python 2.7, 3.3, 3.4 and 3.5. Check https://travis-ci.org/inveniosoftware/pynpm/pull_requests and make sure that the tests pass for all supported Python versions.

4.2 Changes

Version 0.1.2 (released 2020-05-06)

• Deprecated Python versions lower than 3.6.0. Now supporting 3.6.0 and 3.7.0.

Version 0.1.1 (released 2017-05-16)

• Fix problem with testing click CLI output.

Version 0.1.0 (released 2017-05-12)

• Initial public release.

4.3 License
